Cyber Security By SLT Enterprise Solutions

Sri Lanka Telecom Head Office.

The SLT Enterprise Solutions arm has strengthened its team of experts in SLT to support businesses with state-of-the art managed security solutions. SLT has joined hands with Fortinet, the global leader in high-performance cybersecurity solutions as well as Arbor Network, the security division of NETSCOUT, provider of DDoS protection in the enterprise, carrier and mobile market segments, to boost next generation managed security services to business organizations.

 "We are always vigilant and we have closely looked at how cybercrime is evolving, and how to fight back and be protected. The reality is that all firms face cyber-attacks. Therefore, those in leadership in organizations need to analyze the possible threat of cyber security, when they are in the boardrooms to prepare strategic and business plans," said M I Deen, Deputy Chief Enterprise and Wholesale Officer, SLT. Commenting further he said, "Decisions to adopt enterprise level managed security services are essential to survive without getting into more trouble and ensuring that as much security as possible is provided to every organization, for them to provide high quality services, without interruption to their own customers." In order to ensure service levels (SLAs) within the organization, Sri Lanka Telecom has established an Information Security Management System (ISMS) covering the internal audits and activities, such as the regular assessment of vulnerability of critical services, penetration testing, compromise assessment, and security architecture reviews, which are conducted on a regular basis to ensure the

compliance with ISO 27001 standard. The company will take remedial actions for any identified vulnerabilities. The security solutions portfolio of SLT includes a Managed Firewall, DDoS Protection and Firewall Advanced services. Through Managed Firewall solutions, enterprise networks are able to protect themselves from various external and/or internal illegal attempts at breaching security. Managed Firewall features an integrated security intelligence with the Unified Threat Management profiles with antimalware protection, data leak prevention, intrusion prevention, web filtering and application control. SLT DDoS Protection Service provides the detection and the mitigation of the Distributed Denial-of-Service (DDoS) attacks, protecting the enterprise networks and ensuring the customer bandwidth is available for legitimate traffic. For all SLT customers, there will be no initial investment for these SLT-managed security products, whilst minimizing the risk of security breaches, improving productivity and also helping to eliminate CAPEX investment for firewalls. The SLT Managed Security Services are aimed at equipping local small, medium and large enterprises with the full range of ICT solutions to help succeed in the global arena
